

NFA TO DFA CONVERSION

- ✚ I designed a page explaining NFA to DFA conversion with converting steps by given regex.
- ✚ Firstly I explained what is DFA and NFA, differences between them and how to convert NFA to DFA. When  is pressed, the next step appear on the screen. When  is pressed, the previous step will appear,  and this button is for resetting. At the same time, the NFA and DFA tables appear on the screen. Finally, adding references.

- ✚ I have `setvalues()`, `ileri()`, `geri()` and `reset()` functions in my code.
- setvalues():** appear selected regex on the screen before the button is pressed
- ileri():** shows next step on the screen, increased the counters in this function.
- geri():** shows previous step on the screen, reduced the counters in this function.
- reset():** reset the counters and the screen is cleared in this function.
